EFLEX-L1 is the L bracket that is part of the EFLEX® system.

If the EFLEX1 cable duct direction does not fit your configuration, for example because you want to redirect your cabling to the ceiling, you can easily change its trajectory by using a second length connected to the first by the L bracket.

Nothing could be simpler: the cable duct is mounted by clipping it on and screwing it to the wall, which also makes the installation more secure. A ring in the corner of the bracket is provided for the screw. This part also facilitates the passage of the cables by guiding them.

A very aesthetic connection: as it is made by overlapping, no cut is visible. The L-shape also saves time by avoiding to make corner cuts directly in the cable duct.

In addition, the satin chrome finish is in perfect harmony with all other elements.
